

# Week 2 Lab

This week's lab is a little different from subsequent labs in that you will be doing a lot of the work in lab. The goal is to get the tools you will need to use at home installed on your computer. These tools are Cygwin and Scratch. Cygwin is a Unix-like system that runs on the Windows kernel. Scratch is a program that introduces you to programming.

You will be led through these activities. In addition, your teacher will come around to see what you have done on Backlog 1. The degree to which you have complete Backlog 1 forms part of the practical grade for the class.

## Demo

Five Marks: one mark for the completion of each of the stories; an additional mark if there are no extra steps in your program.

This demo and the next one are unusual in that the backlog must be completed in a single week. Usually, backlog will cover more than one week to help you learn to budget time.
